## Notes: Spread, Treatment, and Prevention of Disease

#### What is a disease outbreak?

- A disease <u>outbreak</u> happens when a disease occurs in greater numbers than expected in a community or <u>region</u>, or during a <u>season</u>.
- An outbreak may occur in one <u>community</u> or even extend to several <u>countries</u>. It can last from days to <u>years</u>.

# What is a disease outbreak? (cont.)

- Sometimes a <u>single</u> case of a contagious disease is considered an outbreak.
- This may be true if it is:
  - a. an <u>unknown</u> disease
  - b. new to a community
  - c. <u>absent</u> from a population for a long time.
- An outbreak can be considered an epidemic or pandemic.

### How do diseases spread?

- Infectious diseases <u>spread</u> in many ways.
  - Pathogens can be found in many places including food, <u>air</u>, <u>water</u>, surfaces.
  - Contact with <u>insects</u> and other animals
    - Insects and animals can also carry <u>organisms</u> that cause disease.
      - Ex. Lyme Disease is caused by bacteria that inhabit ticks.
      - Rabies, a deadly central <u>nervous</u> system infection is caused by a <u>virus</u> and is found in the <u>saliva</u> of infected animals, such as <u>bats</u>, raccoons, etc.
  - Person-to-Person Contact
    - Most of the <u>illnesses</u> you have had have probably been passed to you by another <u>person</u>.
- To avoid giving/receiving pathogens, you should wash your hands.

#### What are Carriers and Vectors?

- Carriers and vectors can spread <u>disease</u>, but generally do not get <u>sick</u> themselves.
- <u>Carrier</u>: a person or animal that has a disease and can <u>pass it on</u>, but does not show any <u>symptoms</u>.
- <u>Vector</u>: an organism (like a mosquito or tick) that <u>carry</u> pathogens from one organism to <u>another</u>.

## How do we treat and prevent diseases?

- Diseases caused by <u>bacteria</u> can be treated with medicines that contain <u>antibiotics</u>.
  - The first antibiotics were discovered in <u>1928</u> by a scientist named Flemming.
- Antimicrobial: something that kills germs (includes hand sanitizer, antibiotics, etc.)
- Scientists continue efforts to <u>prevent</u> and <u>treat</u> illness.
  - Vaccine: a substance that contains a <u>weakened</u> or <u>killed</u> pathogen, such as a bacterium or <u>virus</u>, or of a portion of the pathogen's <u>structure</u> that stimulates <u>antibody</u> production or cellular <u>immunity</u> against the pathogen but cannot cause <u>severe</u> infection. Vaccines <u>prevent</u> illnesses (not <u>treat</u> them!). The use of vaccines has made some diseases nearly <u>extinct</u>.
  - Antibiotics fight <u>pathogens</u> (bacteria), but they can also lead to <u>changes</u> in them.

## How do we treat and prevent diseases? (cont..)

- When an antibiotic is used too <u>often</u>, bacteria can develop <u>resistance</u>, meaning it is no longer <u>affected</u> by the antibiotic.
- The next time those bacteria <u>invade</u> your body, that particular antibiotic will not <u>stop</u> the disease.

## What is the difference between an epidemic and a pandemic?

- Epidemic and <u>pandemic</u> refer to the spread of <u>infectious</u> diseases among a population.
  - Epidemic: when a disease spreads to a <u>large</u> number of people, but remains in a specific, <u>local</u> area.
  - Pandemic: when a disease spreads to <u>numerous</u> places around the <u>world</u>. A widespread epidemic.
    In the most extreme case, the entire <u>global</u> population would be affected by a pandemic.

### Epidemic vs. Pandemic (cont.)

- The terms epidemic and pandemic usually refer to the <u>rate</u> of infection, the <u>area</u> that is affected or both.
  - An epidemic is defined as an illness or health-related issue that is showing up in more cases than would normally be expected. It occurs when an infectious disease spreads rapidly to many people. In 2003, the severe acute respiratory syndrome (SARS) epidemic took the lives of nearly 800 people worldwide.

### Epidemic vs. Pandemic (cont.)

 In the case of a pandemic, even more of the population is affected than in an epidemic. A pandemic typically is in a widespread area (usually worldwide) rather than being confined to a particular <u>location</u> or region and affect global populations. An epidemic is not worldwide. For example, malaria can reach epidemic levels in regions of Africa but is not a threat globally. However, a <u>flu</u> strain can begin locally (epidemic) but eventually spread globally (pandemic).

### Epidemic vs. Pandemic (cont.)

• This is not unusual for a <u>new</u> virus, because if people have not been exposed to the virus before, their immune systems are not ready to fight it off, and more people become ill. Swine flu started in Mexico city, and it was feared to lead to epidemic proportions in North America. Now that the flu has been found in New Zealand, Israel, Scotland and many other countries, it has become pandemic. The 1918 Spanish flu and the Black Plague are extreme examples of pandemics. Keep in mind, though, that a pandemic doesn't necessarily mean millions of deaths—it means a geographically widespread epidemic.

#### **Influenza Pandemics**

- <u>Influenza</u> pandemics have occurred more than once. Spanish influenza killed <u>40-50</u> million people in <u>1918</u>. The Asian influenza killed <u>2</u> million people in 1957. The Hong Kong influenza killed <u>1</u> million people in 1968.
- An influenza <u>pandemic</u> occurs when a new <u>subtype</u> of <u>virus</u> arises. This means humans have little or no <u>immunity</u> to it; therefore, <u>everyone</u> is at risk. The virus spreads easily from <u>person</u> to person, such as through <u>sneezing</u> or coughing. As it spreads, the virus can begin to cause <u>serious</u> illness worldwide. With past flu pandemics, the virus reached all parts of the <u>globe</u> within <u>six</u> to <u>nine</u> months. With the speed of <u>air</u> travel today, public health experts believe an influenza pandemic could spread much more <u>quickly</u>. A pandemic can occur in <u>waves</u>, and all parts of the world may not be affected at the same <u>time</u>.

#### Homework:

- Finish the notes questions
- Review Typhoid Mary and Vectors
